7 Grow Tips: for the beginner

1

Ask questions, read and research.
From social media and YouTube to published articles, the information is at your fingertips. Dedicate time and listen.

2

Make your Rooms white.
From floors to ceilings and everything in between, choosing white paint, equipment, and finishes can benefit your grow. White increase visibility helps to identify pests and molds in the room. White also increases reflection within the room.

3

pH matters
Don't forget to check your water's pH level. Cannabis prefers a pH level of 5.8-6.2. This is especially important for indoor growers.

4

Check your Water
Check the purity of the water, not just pH. Reverse Osmosis water is recommended in most parts of the country.

5

Nutrients are a must
There are literally hundreds of brands and nutrient programs. Choose one and follow the directions. Whether you grow organic or not there's a nutrient program that will suit your needs.

6

Prevention is key
When it comes to security, automation, and pests. Prevention is key. Make sure you have procedures in play for pest control. It is easier to prevent than control an infestation.

7

Control your environment
There are so many automated options out there to help you make sure your environment is ideal for cannabis conditions. From humidity to CO2 everything should be monitored and controlled.

Genetics: Photo -v- Auto?

Picking genetics can be tricky. First and foremost be sure you know exactly how, what, and why your growing your specific strands. Different strands produce higher yields, higher cannabinoid content, and also more oils. It is also very important to purchase and grow seeds from a reputable breeder.

That being said, there are also different types of seeds to choose from. Regular photo period seeds can produce both male and female plants. Photo feminized seeds are 99% all female plants (there's always a chance that a feminized seed can still be male and/or hermaphrodite). Auto flowering seeds are all feminized plants that don't require any light deprivation to initiate the flowering or budding phase. Advantages of auto-flowers are they can be much easier to grow. They also harvest sooner than photos. The advantages of growing photo period plants will be that they will typically yield more. The ability to control when you switch to the flowering phase gives you the ability to grow the plant larger.

As far as cannabinoid content, THC and CBD levels depend greatly on how the plant is treated during the grow process and the strain genetics. Reputable breeders will provide specifications on cannabinoid content range and dominant terpenes along with grow information.
